

Glossary

Border Gateway Protocol

The routing protocol of the Internet that routes traffic across the internet.

BGP

Border Gateway Protocol

The routing protocol of the Internet that routes traffic across the internet.

BGP

End of rack

Data center configuration where each server in individual racks are connected to a common EOR aggregation switch directly, without connecting to individual switches in each rack. See also TOR (top of rack).

EOR

end of rack

Data center configuration where each server in individual racks are connected to a common EOR aggregation switch directly, without connecting to individual switches in each rack. See also TOR (top of rack).

EOR

No definition

Software Defined Network

OpenShift Container Platform uses software defined networking to provide a unified cluster network so that pods communicate with each other across the cluster. OpenShift SDN establishes and maintains this pod network

SDN

top of rack

Data center configuration where each server in individual racks are connected to a common EOR aggregation switch directly. The servers do not connect to individual switches in each rack. See also EOR (end of rack).
